Introduction

Zhejiang Metong Machinery has been building road equipment since 2000. The company grew out of Zhejiang Road Materials Company and Zhejiang Road Machinery Factory, and it is still run as a manufacturer rather than a trading house: design, fabrication, assembly and testing happen on its own two production sites.

The product range follows the road itself. Construction equipment builds the pavement; maintenance equipment keeps it in service; plants and bitumen processing supply the material that both depend on. Across the range the design principle is the same — production truck chassis, hydraulic drive, and a control system that lets an operator hold a measured rate rather than approximate one.

Equipment is exported to more than 100 countries. That is not a marketing line: it is the reason the company carries regional offices in Iran, India, Sri Lanka, Ethiopia and Russia, and the reason documentation, commissioning support and spares are treated as part of the product rather than an after-sale courtesy.

Certification

Metong's quality system has been certified since the early 2000s and is audited rather than self-declared. ISO 9001 certification was obtained in 2006; the company was approved under CCMQS and CCC in 2002. Alongside the management-system certificates, the archive holds product test reports, export licences and more than 150 patents and registrations.

Certificates are issued per product family, so the document set that ships with a machine depends on the model and the destination market. If your tender requires a specific certificate

— a CE declaration, a third-party test report, or a certificate of origin — state it at enquiry stage and the matching document is issued with the order.
